

FULFILLIQ STAGE 5

Decision brief: enroll 18 sellers

Maya Chen, Director of Marketplace Seller Operations · decide by 18 September 2026

1. Decision

Maya, as Director of Marketplace Seller Operations, will decide by 18 September 2026 which sellers in the FulfillIQ Olist Brazil database, if any, to enroll in a 30-day late-fulfillment performance plan rather than leave on standard terms. The list is informed by delivered orders those sellers fulfilled with order_purchase_timestamp from 1 January 2018 through 31 August 2018. The purpose is to reduce late customer deliveries before the VP meeting, without penalizing sellers whose volume is too small or whose orders never delivered. Featured placement is operations, not a column. Offboarding is a later VP recommendation, not this decision.

Framing question: among sellers who fulfilled delivered orders purchased 1 January–31 August 2018, which show late-fulfillment that would support enrollment versus standard terms? Cap about 20 concurrent plans. Peer rule (Stage 3): $LFR \geq P75$ of $n \geq 30$ and $LFR >$ seller-order-weighted marketplace LFR; if the clean P75 set >20 , raise the enroll bar to P90; do not pad. Volume floor ≥ 30 usable seller-orders after exclusions (provisional). Working lateness: $DATE(actual) > DATE(estimate)$; timestamp twin required.

Recommended action (Option A): enroll the 18 sellers already classified enroll. All three independent reviews (Grok, ChatGPT, DeepSeek) remain on A after Round 2. The three-AI recommendation is decision support. Maya or an authorized human retains approval (Section 6).

2. Executed facts (CSV / workbook)

From output/Stage_04_seller_export.csv after R assure and results/2026-09-02/FulfillIQ_R_Evidence_2026-09-02.xlsx. Two junk CSV rows from a city newline were stitched; they are not extra sellers. SQL (sql/Stage_04_FulfillIQ_Analysis.sql) is implementation, not execution proof. R ran 2 September 2026; rate/flag/action reconciliation passed after treating lfr_date_pct display rounding as non-fatal ($<0.5pp$).

Clean sellers	2,329
Eligible seller-orders / late / overall LFR	53,611 / 4,084 / 7.62%
$n \geq 30$ floor / below floor	393 / 1,936
peer_weighted_mkt_lfr / median	0.07808 / 0.06667
peer_p75 / peer_p90	0.10169 / 0.14286
raise_bar_to_p90	1 (clean P75 pool >20)
pass_p75 / pass_p90	99 / 40
Actions (enroll / watch / inconcl. / std)	18 / 63 / 36 / 2,212

Watch split	51 split_window_unstable + 12 p75_watch_band_after_cap
Inconclusive / attribution_conflict	36 all date_vs_timestamp_action_conflict / 0
Floor volume bands 30-49 / 50-99 / 100+	159 / 141 / 93
Enroll reason (all 18)	p90_and_above_weighted_after_cap

pass_p90 = 40 and enroll = 18 are facts. The pack does not include a cross-tab of the other 22 P90 passers. Do not reconstruct that path. 18 is a rule output, not a target, not “the worst 18,” not “the top 18 performers.” Empty cap slots are unused capacity, not missing evidence.

3. The 18 names

Rank, seller_id, state, eligible_n, late_n/eligible_n, lfr_date, lfr_timestamp from round1-grok.md (same table as the Stage 5 evidence pack, transcribed from the executed export / enroll sheet). State mix: SP 14, RJ 2, SC 1, MA 1. Date LFR 0.143–0.288. Rank numbers skip; that skip is observed, not a published filter of the 40.

Rk	seller_id	St	n	late/n	lfr_d	lfr_ts
2	c3867b4666c7d76867627c2f7fb22e21	SP	80	23/80	0.288	0.300

Best existing chart (do not reconstruct pixels): workbook sheet charts, Figure 1 — Seller LFR vs eligible volume with floor, peer bar, and action. File: results/2026-09-02/FulfillIQ_R_Evidence_2026-09-02.xlsx. Why: denominator and rate together, so Maya does not enroll a high rate with a tiny n, and 18 vs watch vs standard without hiding volume.

4. Recommendation

Proceed with Option A. Enroll the 18. Implementation: 30-day plan; do not fill empty cap slots; keep watch and inconclusive classified; no new KPI cuts. Monitoring: LFR as late_n/eligible_n;

stop/review if precision would flip the action or volume collapses. Maya retains approval.

Three executive bullets

- Enroll the 18 P90-and-above sellers who cleared stability and precision screens; leave two ~20-cap slots empty.
- Do not pad; do not enroll the 99 P75 passers; 51 split-window and 36 precision-conflict sellers stay watch/inconclusive.
- This is targeting under locked 2018 delivered-order rules, not proof the 30-day plan will reduce lateness in 2026.

Three next actions

- Maya approve the 18 by 18 September 2026.
- Seller ops open 30-day plans; do not convert watch/inconclusive.
- Report late_n/eligible_n for the 18 during the plan; do not invent a new bar.

Options not selected as the statistical decision

- B enroll fewer: not a new statistical rule. Allowed only as a staffing contingency if Maya cannot run 18 plans. Do not invent a 10-11 cutoff.
- C enroll the P75 band: reject (raise_bar_to_p90=1; 99 > 20). D pad to 20: reject. E enroll nobody: reject (operational null not supported). F defer: reject as default. G offboarding: out of scope.

5. Limitations and confidence

Confidence is MODERATE overall. HIGH on process and rule compliance (floor, raise-to-P90, action classes, QA pass, cap, no-pad). Lower on transporting the 2018 window to a September 2026 decision, and on small-n / P90-edge sellers inside the 18. Use high/moderate/low. Do not use x/10 scores.

Hypothesis (Stage 3) is SUPPORTED for the 18: volume floor, above P90 peer bar after raise, split-window not flagged, attribution OK (0 conflicts), precision did not flip action, cap respected. The operational null (nobody enrollable) is NOT supported. Do not claim a causal plan effect. Do not claim 2026 performance equals 2018.

Unresolved, not blocking A:

- No 40-to-18 cross-tab in the pack. ChatGPT is correct: 40 and 18 are facts; the path of the other 22 is not shown. Do not reconstruct ranking/weights.
- 2018 evidence vs a 18 Sep 2026 decision: historical rule-satisfaction, not current propensity.
- Treatment effect of the 30-day plan is unknown.
- P90-edge and small-n fragility (including displayed 0.143 on 12/84, and n=32-39). Monitoring issue, not a rewritten bar.

Claims removed in coordinator merge (not majority vote; Stage 3 + executed results control): DeepSeek's 40 trimmed by ranking/weights; ~3.1pp from one extra on-time delivery (wrong math: 5/32 vs 4/32 is ~3.1 if a late flips, not if n+1 on-time); 0.014pp above P90; 9.5/10 scores; "early offboarding"; "top 18 performers." Grok's implied 36+51 deducted from the 40 P90 (counts exceed 40; no cross-tab).

Remaining dissent after Round 2: all three remain on A. Dissent is about (B) as a staffing overlay and about reconstructing 40→18, not a different letter.

6. Human approval

The three-AI recommendation is decision support. It is not self-executing. Maya Chen, Director of Marketplace Seller Operations (or another authorized human) retains approval of which sellers, if any, enter the 30-day plan. Until the block below is signed, the 18 remain a recommended list, not an executed enrollment.

Recommended action	Option A — enroll the 18
Decision owner	Maya Chen, Director of Marketplace Seller Operations
Deadline	18 September 2026
Human approval (name)	
Date signed	
Decision	Approve enroll-18 / staffing trim B / Reject

Notes: _____

This pack does not authorize padding to 20, enrolling the 99 P75 passers, converting watch/inconclusive, offboarding, a new statistical cutoff after seeing the list, or treating SQL as live-execution proof.
